

We are solving 13, an easy cryptography challenge where we are decrypting the provided flag.

The challenge already provides the encrypted flag and tells me it is encrypted using ROT13:

ROT13 is a Caesar cipher where each letter in a plaintext is shifted 13 times to produce the corresponding letter in the ciphertext. Knowing this, it becomes easy to solve. All I have to do is shift each letter in the ciphertext 13 times and I will get the flag. I wrote a simple Python script to handle this:

```
(hackingmastermind@ctfdestroyingMACHINE)-[~/Downloads]
$ cat rot13.py
encrypted_flag = 'cvpbPGS{abg_gbb_onq_bs_n_ceboyrz}'

flag = ''
for i in encrypted_flag:
    if i in 'abcdefghijklmnopqrstuvwxyz':
        tmp = ord(i)+13
        if tmp > 122:
            flag += chr(96+(tmp-122))
        else:
            flag += chr(tmp)
    elif i in 'ABCDEFGHIJKLMNOPQRSTUVWXYZ':
        tmp = ord(i)+13
        if tmp > 90:
            flag += chr(64+(tmp-90))
        else:
            flag += chr(tmp)
    else:
        flag += i
print(flag)
```

Once I ran it, I got the flag:

```
(hackingmastermind@ctfdestroyingMACHINE)~/Downloads  
$ python3 rot13.py  
picoCTF{not_too_bad_of_a_problem}  
  
(hackingmastermind@ctfdestroyingMACHINE)~/Downloads  
$
```

flag: picoCTF{not_too_bad_of_a_problem}
